Project Overview

Purpose:

- To digitize and centralize drug development processes in the pharmaceutical industry.

Key Features:

- Automated workflows for research, trials, approvals, and compliance.
- Real-time monitoring of drug development progress.
- Integration of regulatory requirements to ensure compliance.

Goals:

- Streamline operations and reduce manual errors.
- Minimize the time required to develop and approve new drugs.
- Improve collaboration among researchers, regulators, and manufacturers.

Target Users:

- Pharmaceutical companies, regulatory authorities, and research organizations.

Functional Requirements

1. Submit New Idea

Record idea details with unique ID and initial status.

2. Review Idea

View, filter, sort ideas.
Add reviewer comments.

3. Approval by M-Level

Approve/disapprove pending ideas.
Update status to "Approved by M-Level."

4. Approval by C-Level

Review M-Level approved ideas.
Update status to "Approved by C-Level."

5. Track Idea

View status updates and progress timeline.

6. Regulatory Compliance

Prepare and approve compliance documents.
Update status to "Approved Compliance."

7. Sales Plan

Develop and generate sales plans with templates.

8. Manage Testing

Track test progress and results.
Approve or request retesting.

9. Product Launch

Plan and track launch milestones.
Update status to "Launch."

Non- Functional Requirements

1. Performance Requirements

Supports up to 100 simultaneous users without degradation.

2. Safety Requirements

Ensures data integrity and accuracy for regulatory compliance and patient safety.

3. Security Requirements

Adheres to global data protection regulations.
Guarantees secure storage and transmission of sensitive data.

4. Software Quality Attributes

Reliability: 99.9% uptime.

Usability: Intuitive interface for users with varying technical expertise.

Maintainability: Modular, well-documented code for easy updates.

5. Business Rules

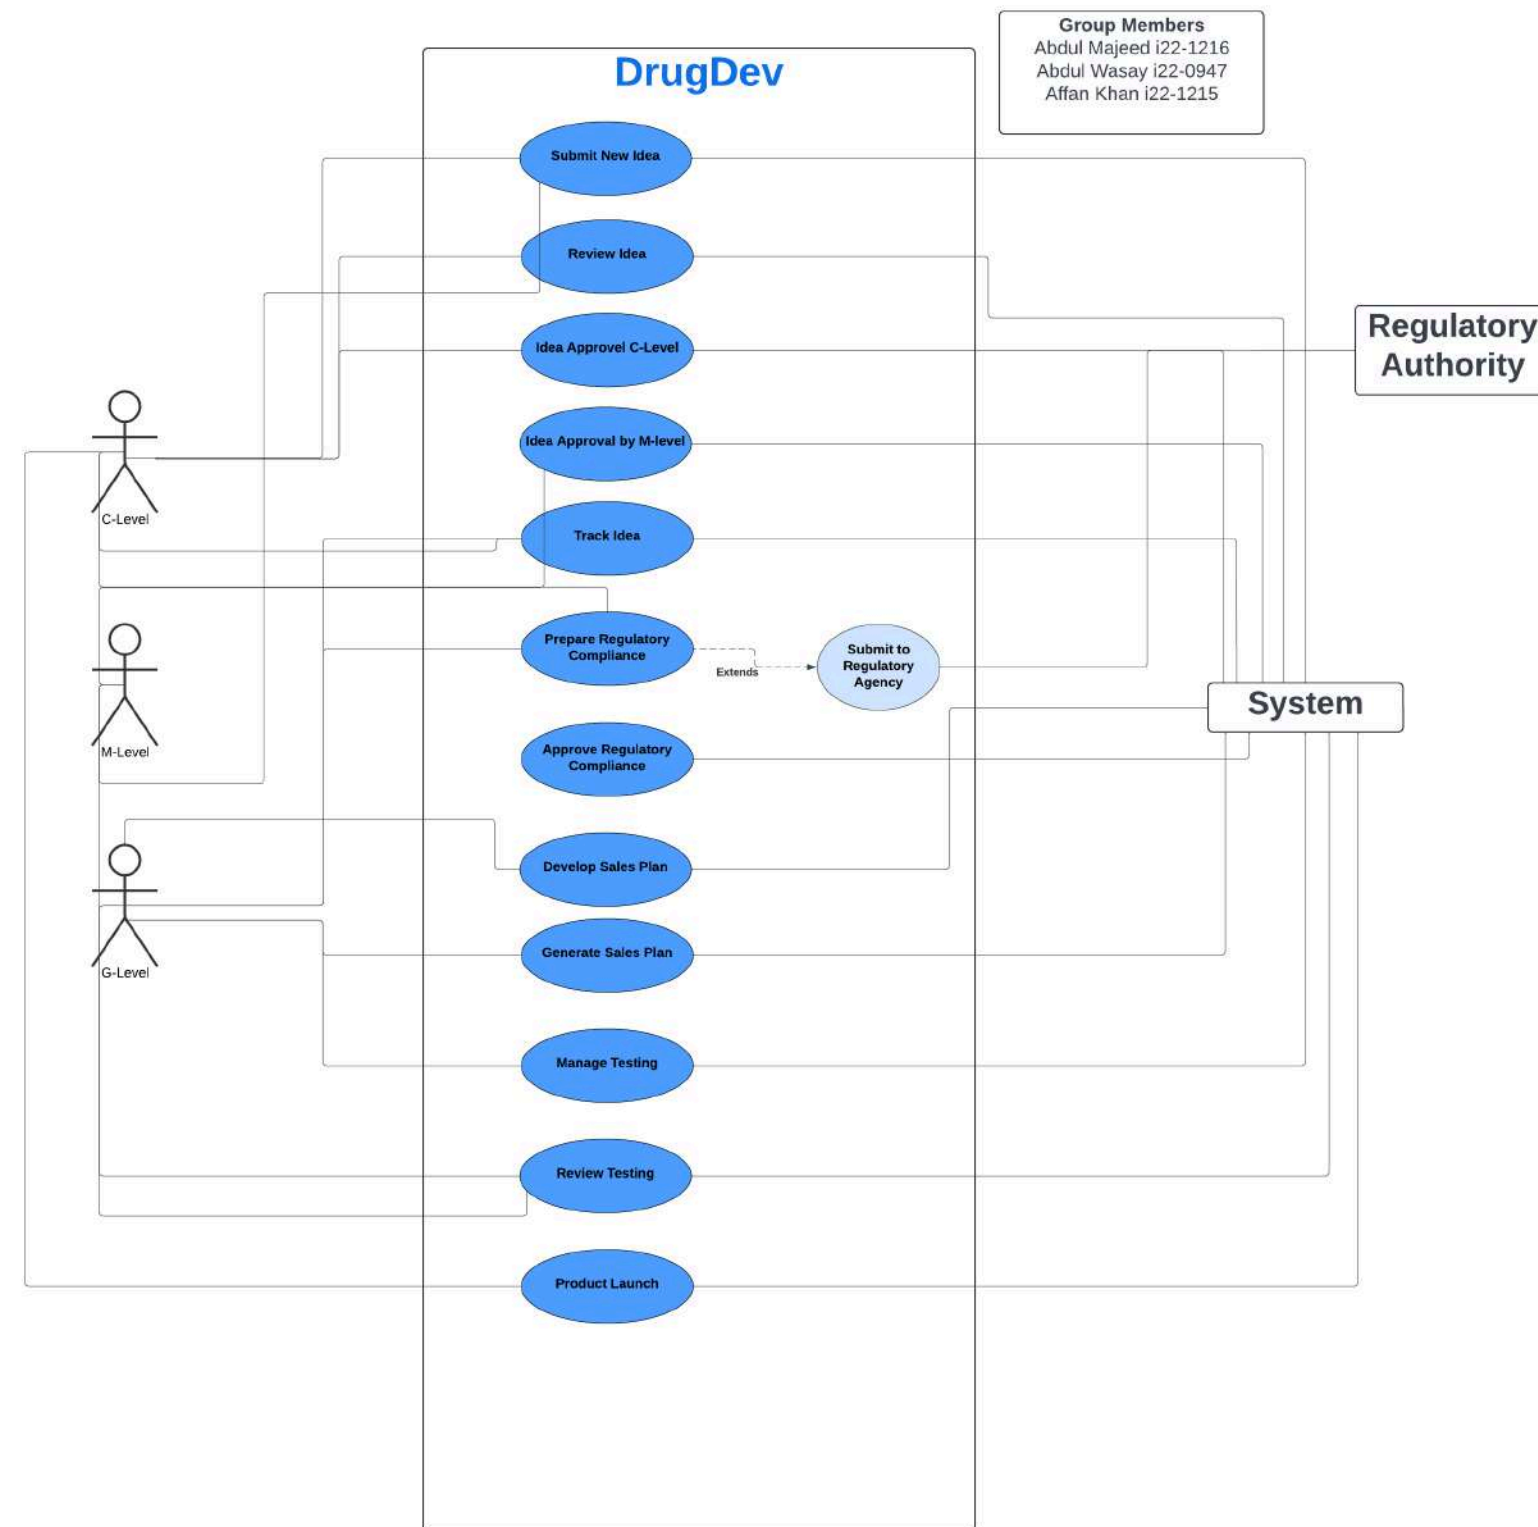

Only authorized personnel can approve ideas.

All data submissions must be audited and traceable.

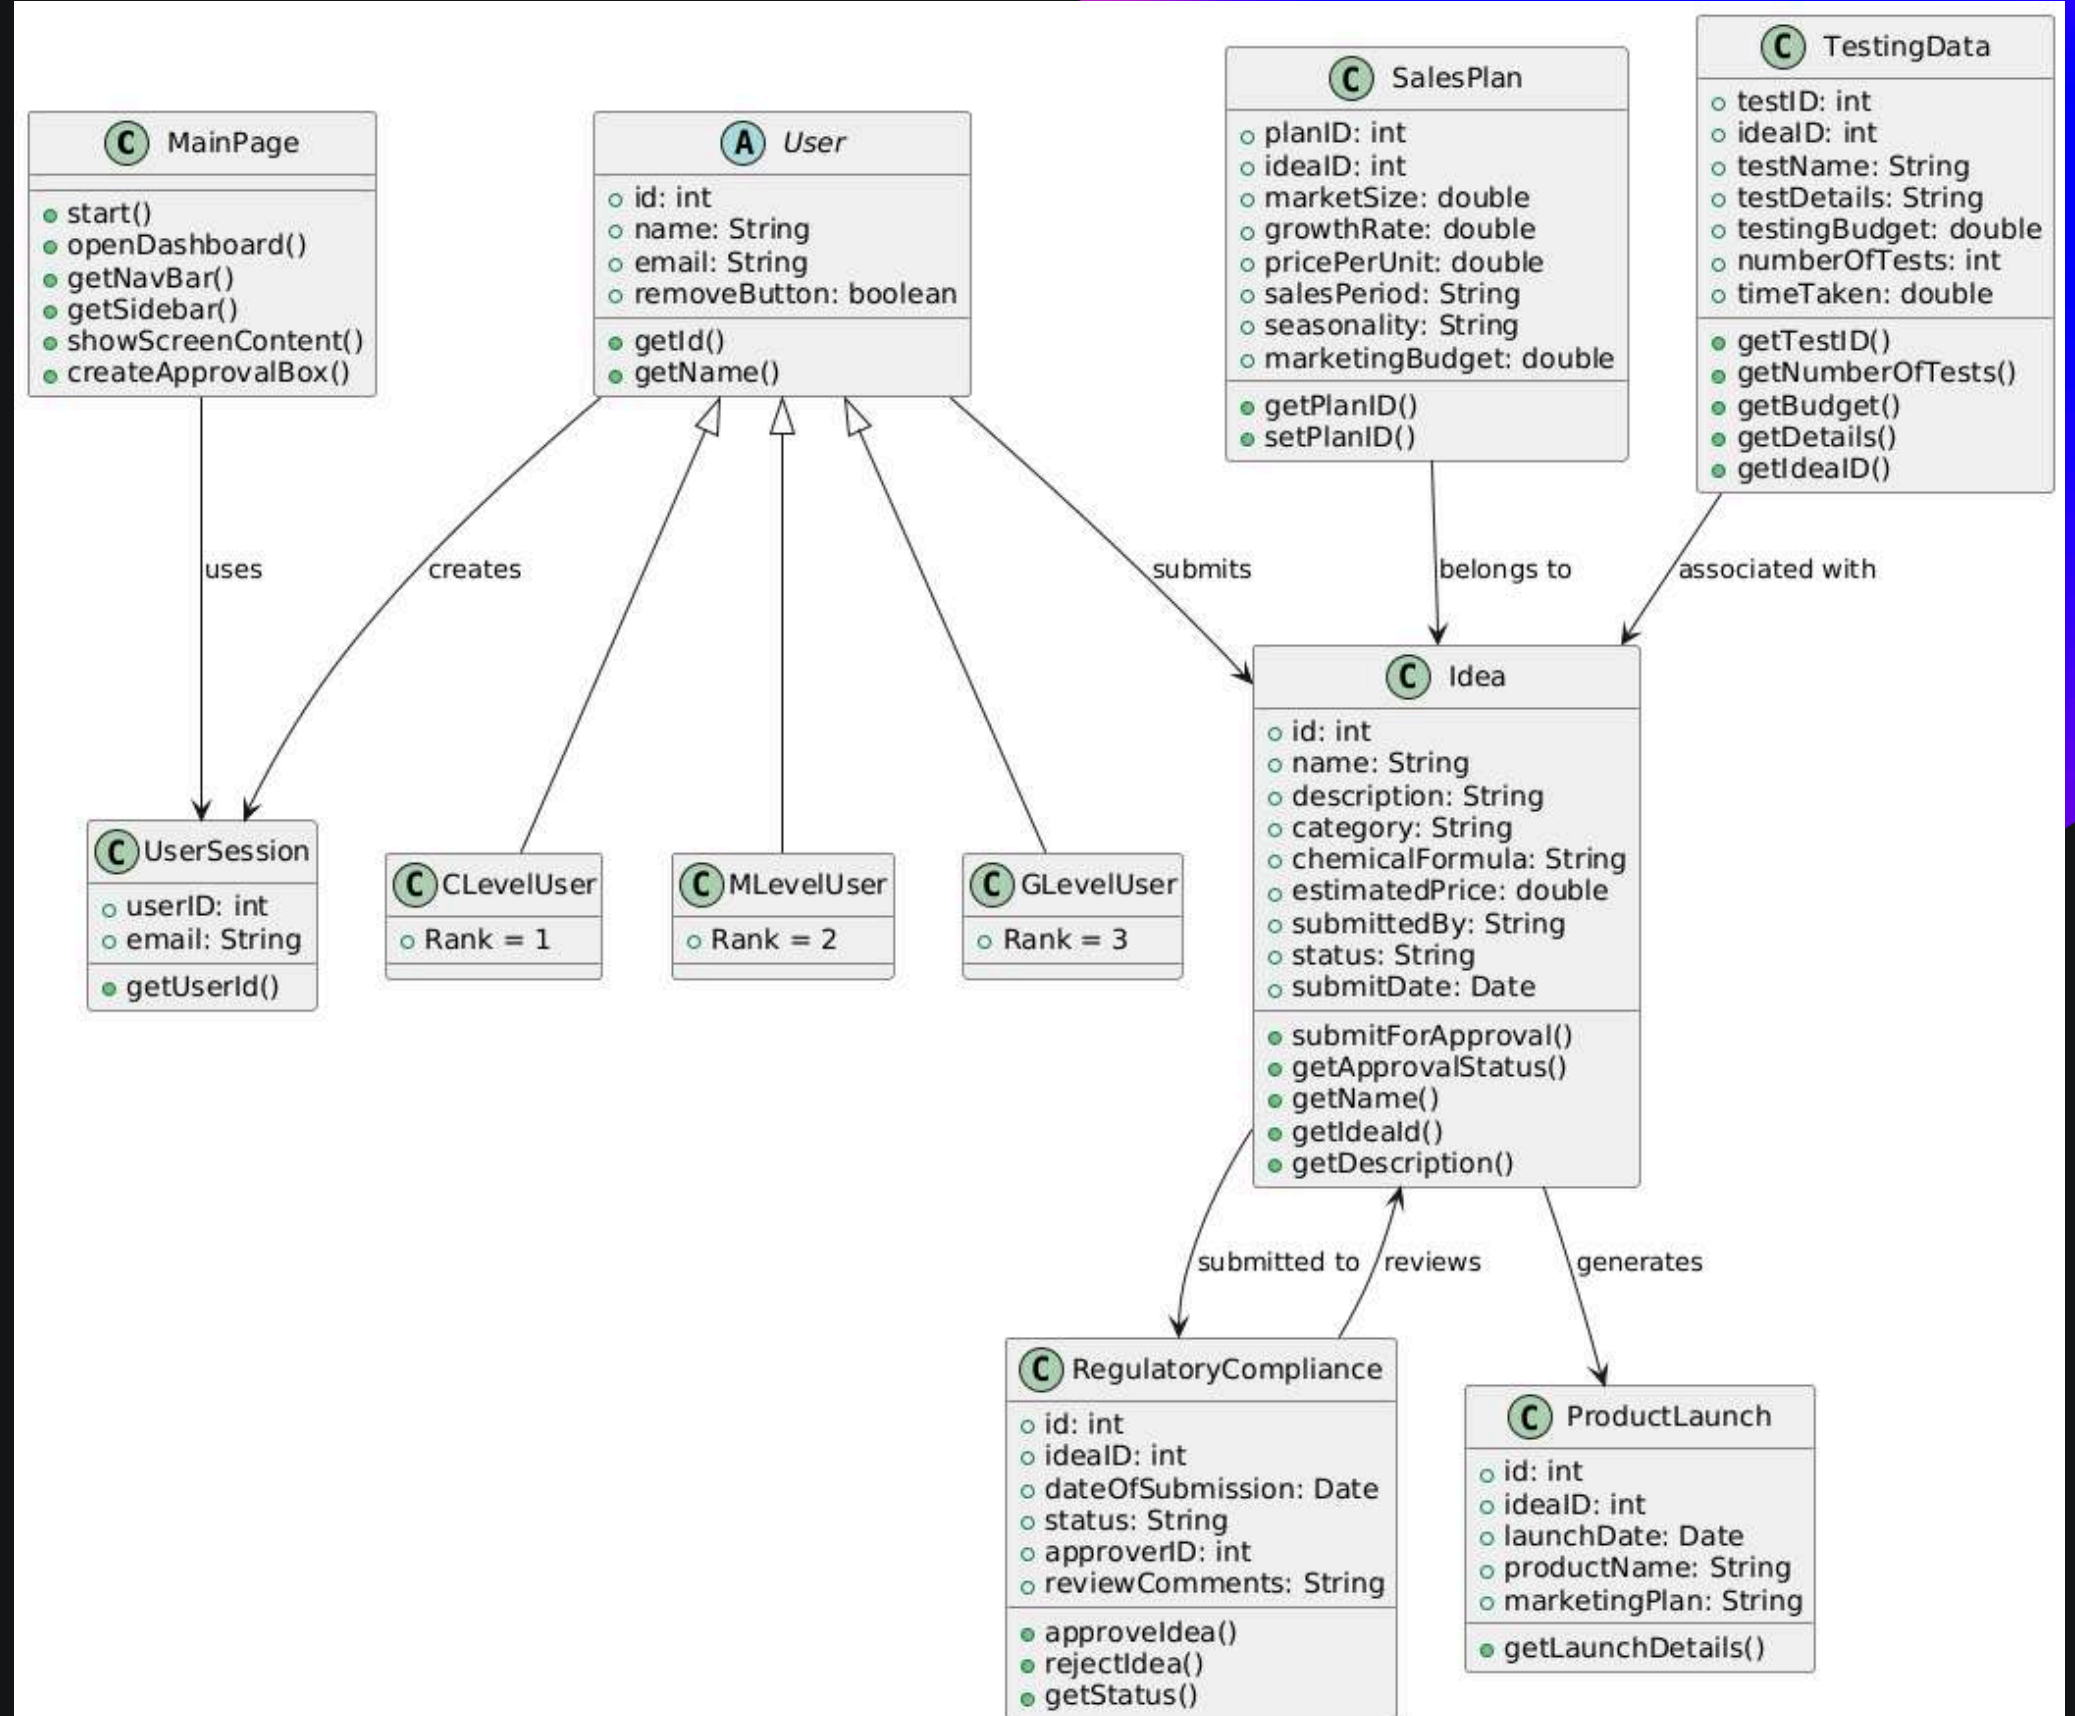

6. Operating Environment

Runs on standard hardware and integrates with major databases and cloud platforms for scalability.

Regulatory Compliance Checklist

Please complete all compliance checks below to proceed.

Select Idea:

Select an Idea

Compliance Requirements

☐ Safety assessment conducted?

☐ Clinical trials conducted?

☐ Packaging materials approved for pharmaceutical use?

☐ Label contains all required information?

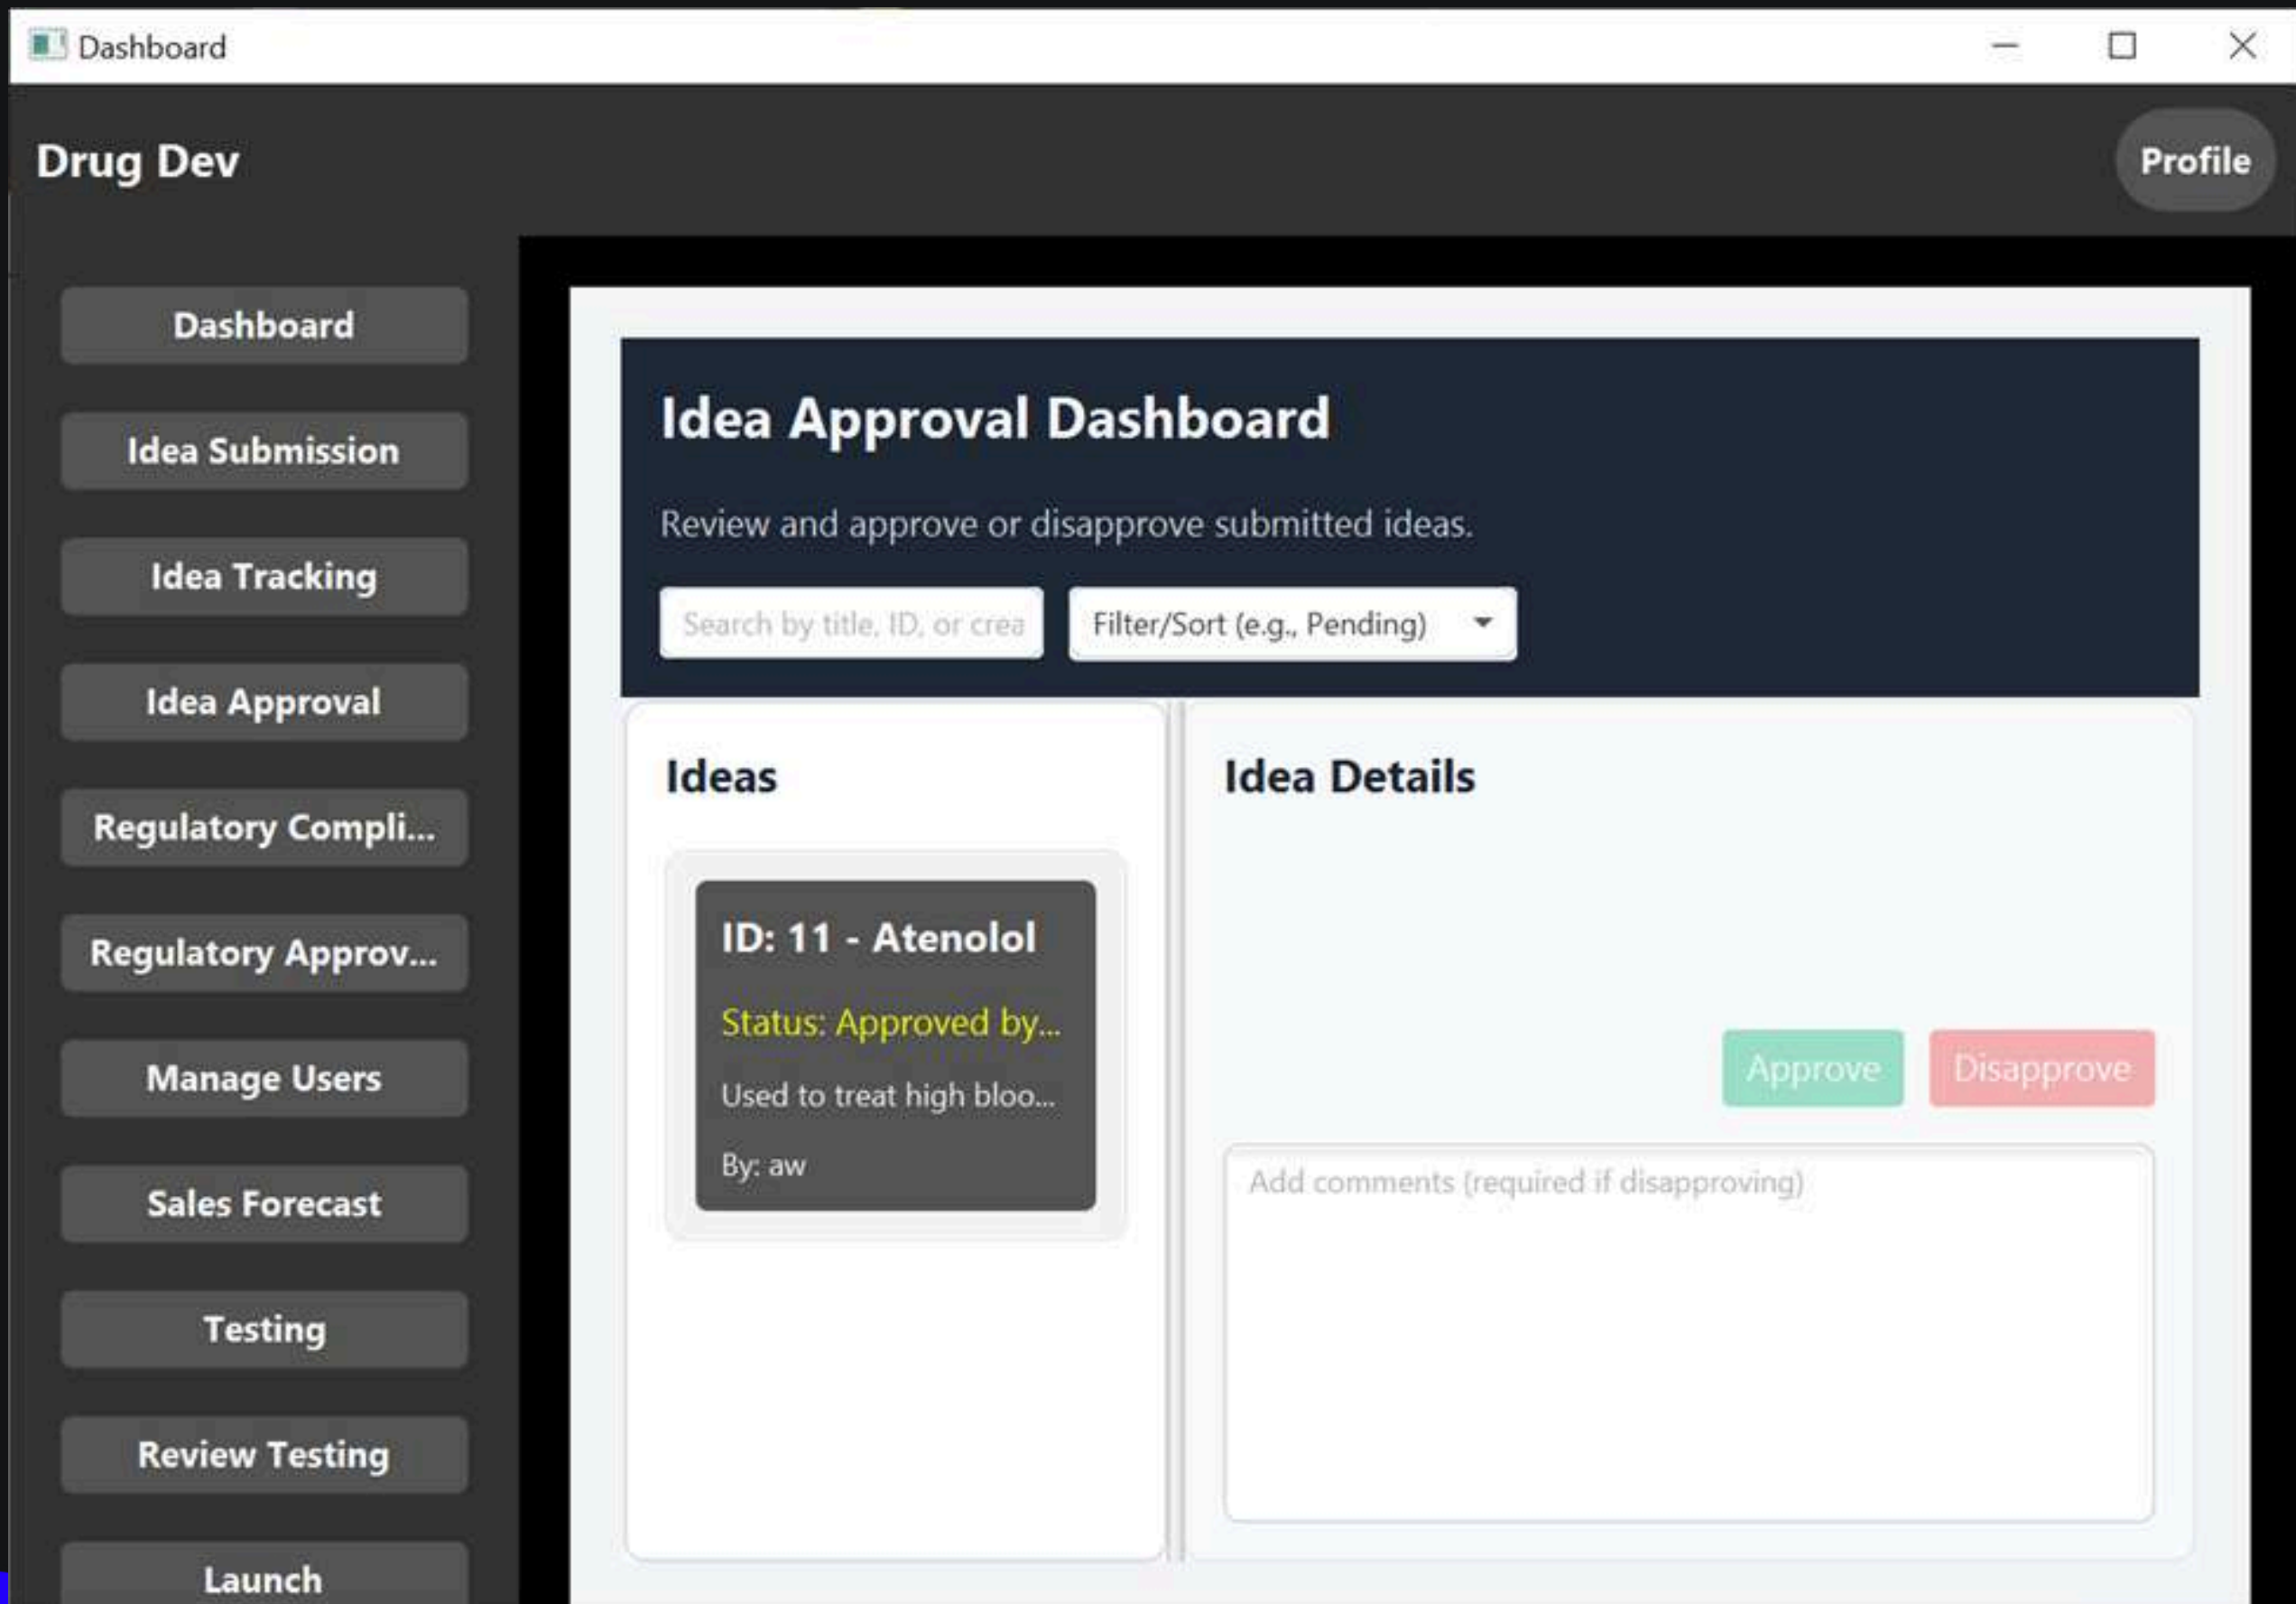

☐ Product approved for distribution in the target market?

☐ I agree to the terms and conditions.

☐ Final compliance confirmation

Status: Pending

Design Patterns

1. Singleton Pattern in database connection

Justification:

- Where: DatabaseConnection.java
- Justification:
 - "The DatabaseConnection class implements the Singleton pattern by maintaining a single shared instance of the database connection. This ensures efficient resource utilization and prevents multiple conflicting connections."

Design Patterns

2.Singleton Pattern in User Session

Justification:

- Where: User session management across the application.
- Evidence:
 - If there's a single session instance used to store details about the currently logged-in user (e.g., username, role, or preferences), this is inherently a Singleton.
 - Check whether there's a shared static object, a globally accessible variable, or a similar mechanism for session management.

Design Patterns

3. Strategy Pattern

Justification:

- **Where:** Controllers in the ui package (e.g., LoginFormController.java)
- **Example Justification:**
 - The LoginFormController and other controllers utilize the Strategy pattern to dynamically handle various user actions, such as login and logout. This separation of concerns enhances flexibility and modularity.

Design Patterns

4. Observer Pattern

Justification:

- **Where:** Views like `IdeaTrackingView.java` and business entities like `Idea.java`
- **Justification:**
 - The `IdeaTrackingView` interacts with `Idea` objects in a manner consistent with the Observer pattern, where the view observes changes in the data and updates dynamically.

GRASP Patterns

1. Controller

- **Justification:**

- **Where:** Controllers in ui (e.g., LoginFormController, DashboardScreenController)
- **Evidence:** These classes handle user inputs and coordinate between views and the backend logic.
 - "The LoginFormController adheres to the GRASP Controller pattern by managing user input, orchestrating application logic, and delegating tasks to the business layer."

GRASP Patterns

2. Information Expert

- **Justification:**

- **Where:** Business logic classes like `User.java`, `Idea.java`, `TestingData.java`
- **Evidence:** These classes encapsulate data and methods closely tied to the data they own.
 - "The `Idea` class demonstrates the Information Expert pattern by encapsulating attributes like title and description and providing methods for operations directly related to its state."

GRASP Patterns

3. Low Coupling

- **Justification:**

- **Where:** Separation between ui, bl, and db layers.
- **Evidence:** Different layers focus on distinct responsibilities, reducing dependencies.
 - "The code achieves low coupling by separating concerns across ui, bl, and db layers, ensuring each component can evolve independently."

GRASP Patterns

4. High Cohesion

- **Justification:**

- **Where:** Smaller classes like `DatabaseSetup.java`, `SidebarView.java`
- **Evidence:** These classes focus on specific, well-defined tasks.
 - "The `SidebarView` class exhibits high cohesion by exclusively managing the sidebar's UI logic, making the code more readable and maintainable."

Thank You
